Convergence rate of $X^N - X$ for McKean equations

Luis Mario Chaparro Jaquez

March 25, 2022

1 What is this?

An adaptation of [1, Proposition 3.1] for the case of McKean SDEs proposed in [2].

The proof builds on a number of results presented in the sections below.

Definition 1 *For any real-valued continuous semi-martingale, the local time at zero $L_t^0(\bar{Y})$ is defined as*

$$L_t^0(\bar{Y}) = \lim_{\epsilon \to 0} \frac{1}{2\epsilon} \int_0^t \mathbb{1}_{\{|\bar{Y}| \leq \epsilon\}} d\langle \bar{Y} \rangle_s, \ \mathbb{P}\text{-a.s.} \tag{1}$$

For all $t \geq 0$.

2 Lemma 5.1

The first result, [1, Lemma 5.1], is not necessary to prove for this particular setting since the result holds for any semi-martingale, I include it here for self-containment reasons.

Lemma 1 (Lemma 5.1) *For any $\epsilon \in (0, 1)$ and any real-valued, continuous semi-martingale*

3 Lemma 5.2

4 Lemma 5.3

5 Proposition 5.4

6 Proposition 3.1 (main result)
